Caching Bug or Feature?

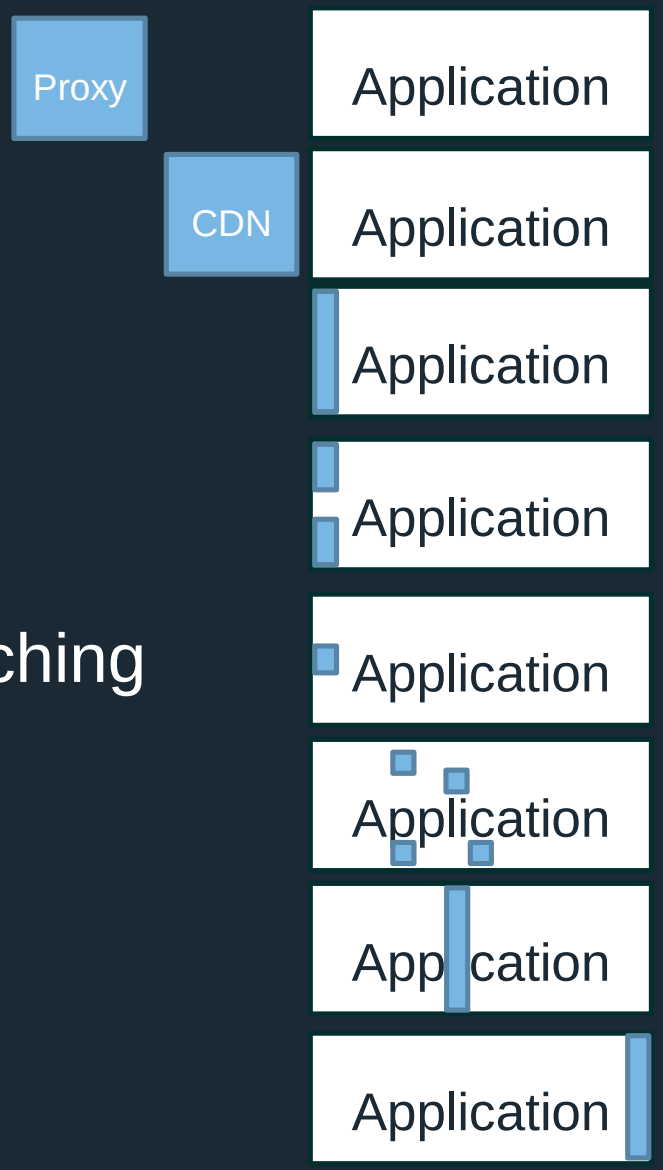
```php
public function getCachedChartBy($get_by, $get_by_value, $date = null, $limit = 100){
  $cachekey = md5("{$get_by}{$get_by_value}{$limit}{$date}");
  return Cache::remember($cachekey, rand(30,300), function() use ($get_by, $get_by_value,
    return $this->getChartBy($get_by, $get_by_value, $date, $limit);
  });
}
```

Why do we cache?

- Limited bandwidth / availability
- Cost
- Blazing fast UX
- SEO
- Poor Performance?

Caching Options

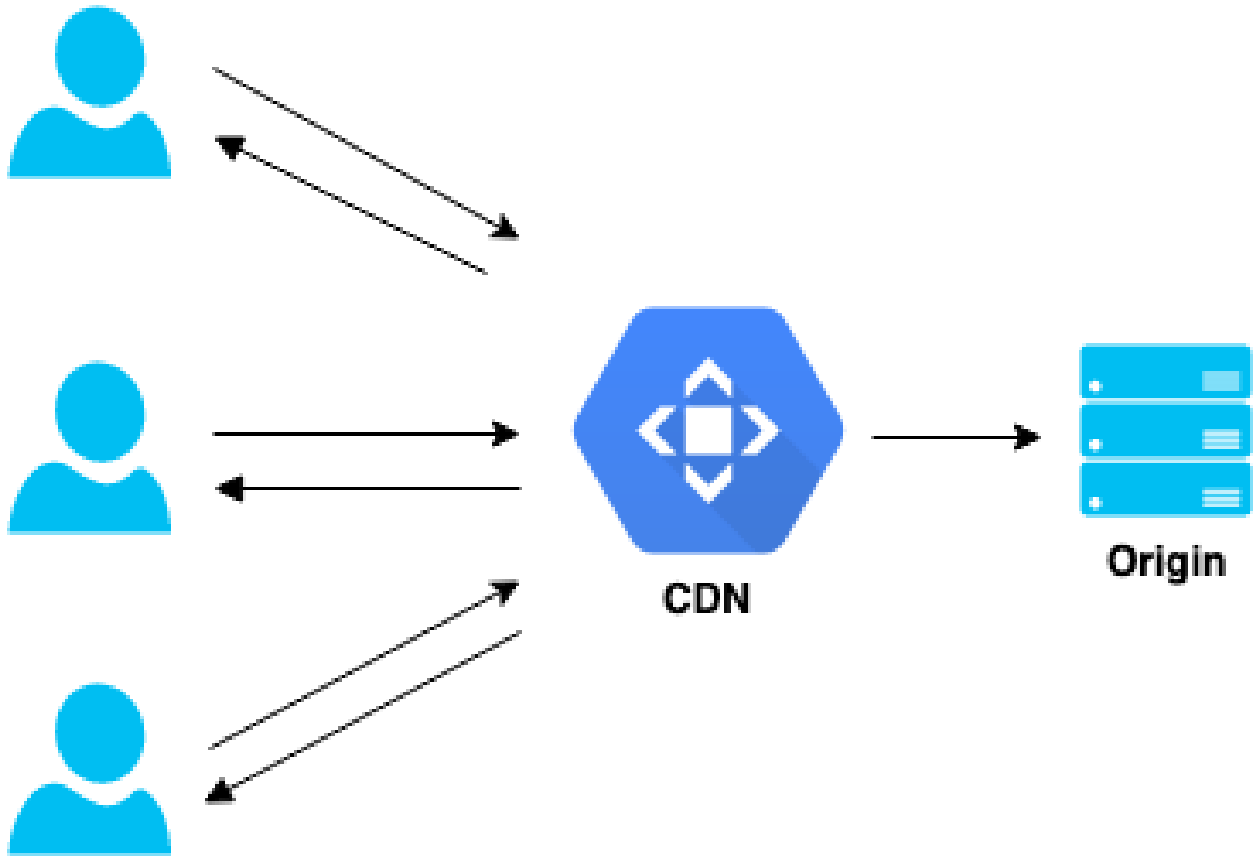
- DNS/Proxy
- Network
- Page Output
- Donut Caching
- Donut Hole Caching
- Methods
- Service layer
- Data layer



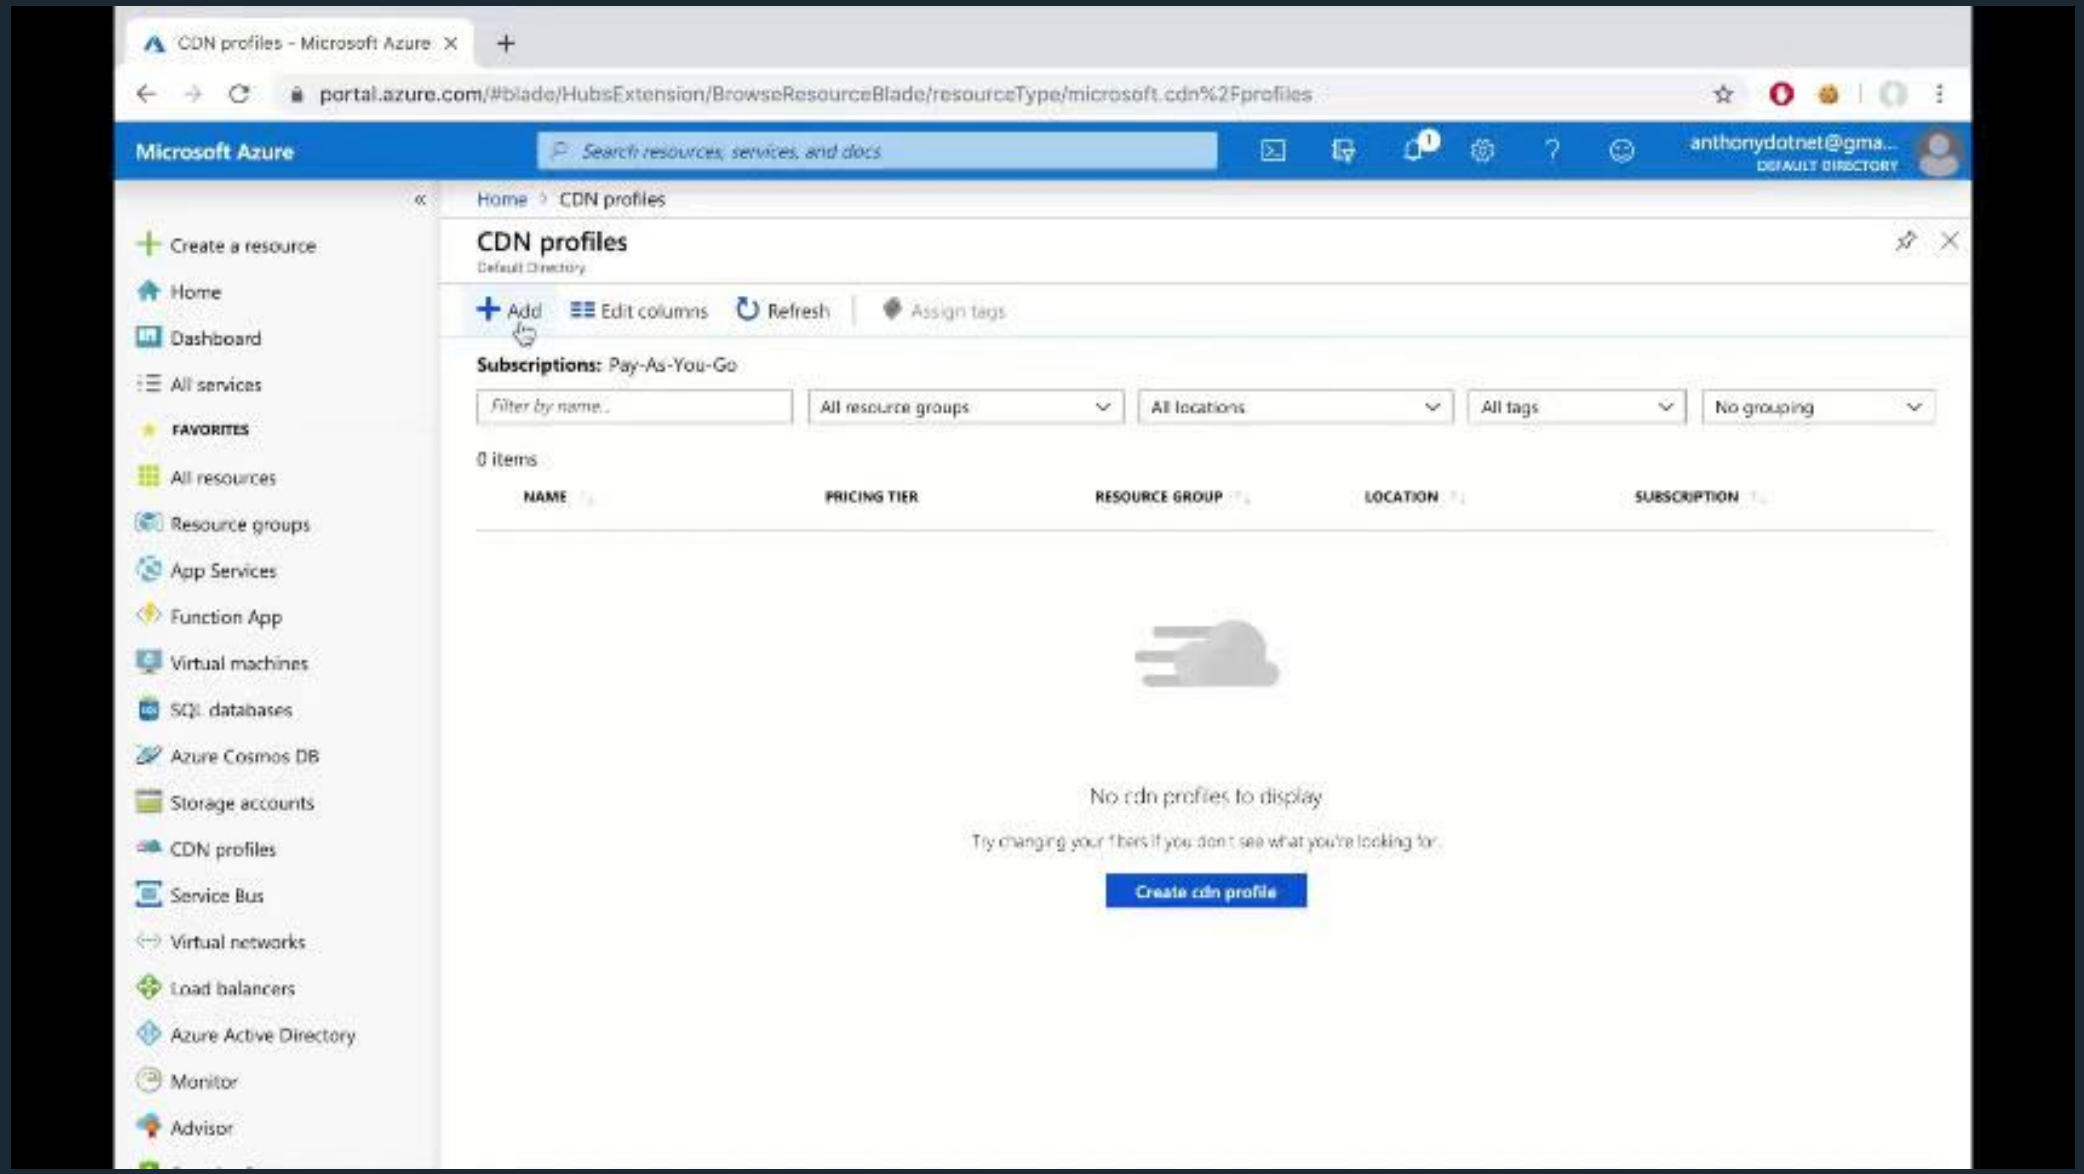
Pre-Indexing

Multi-layered

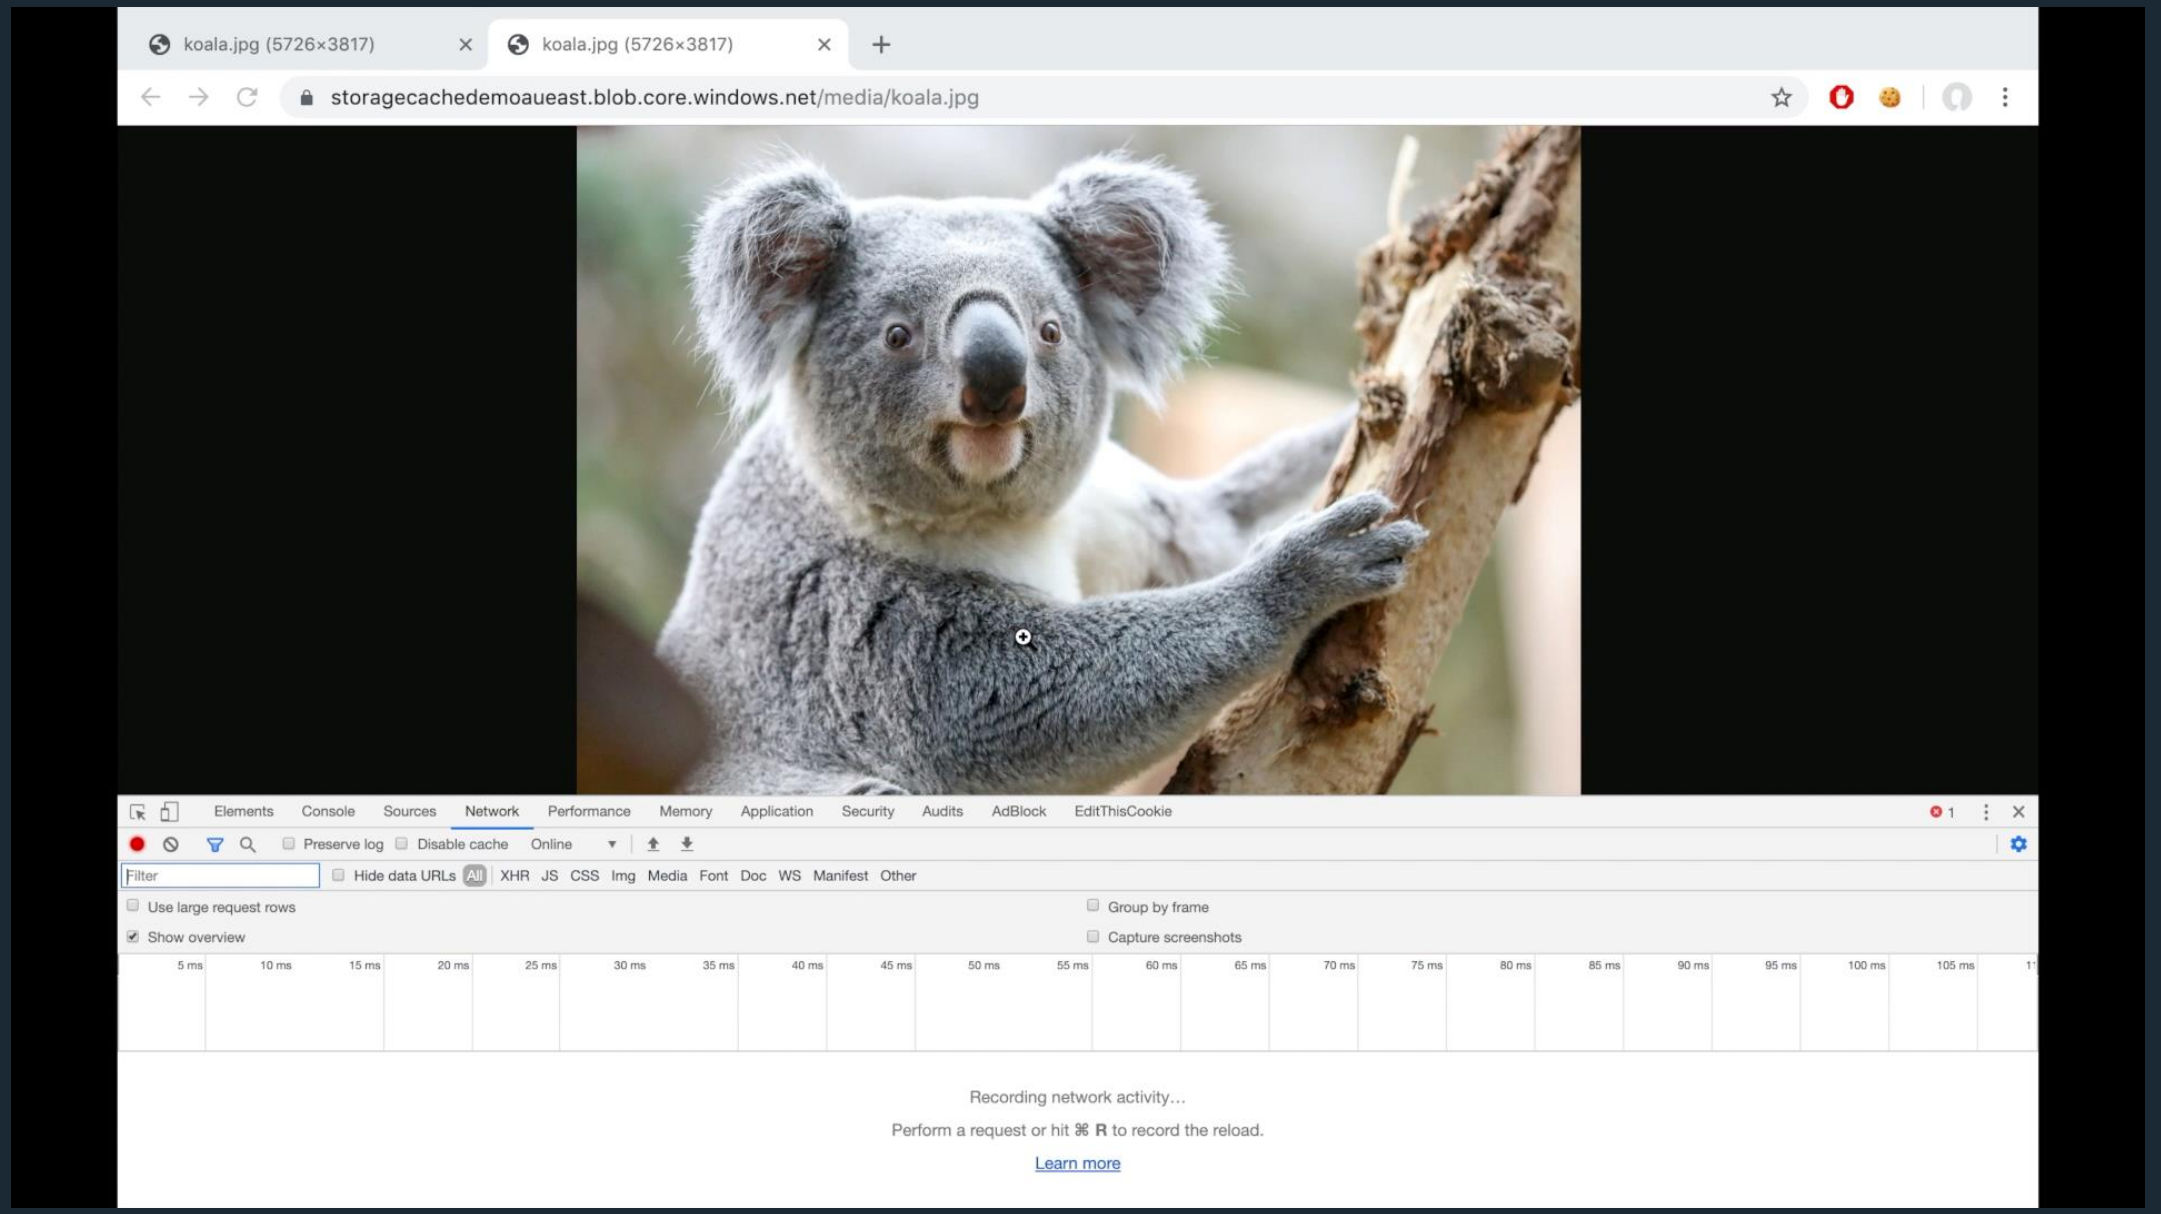
Content Delivery Networks



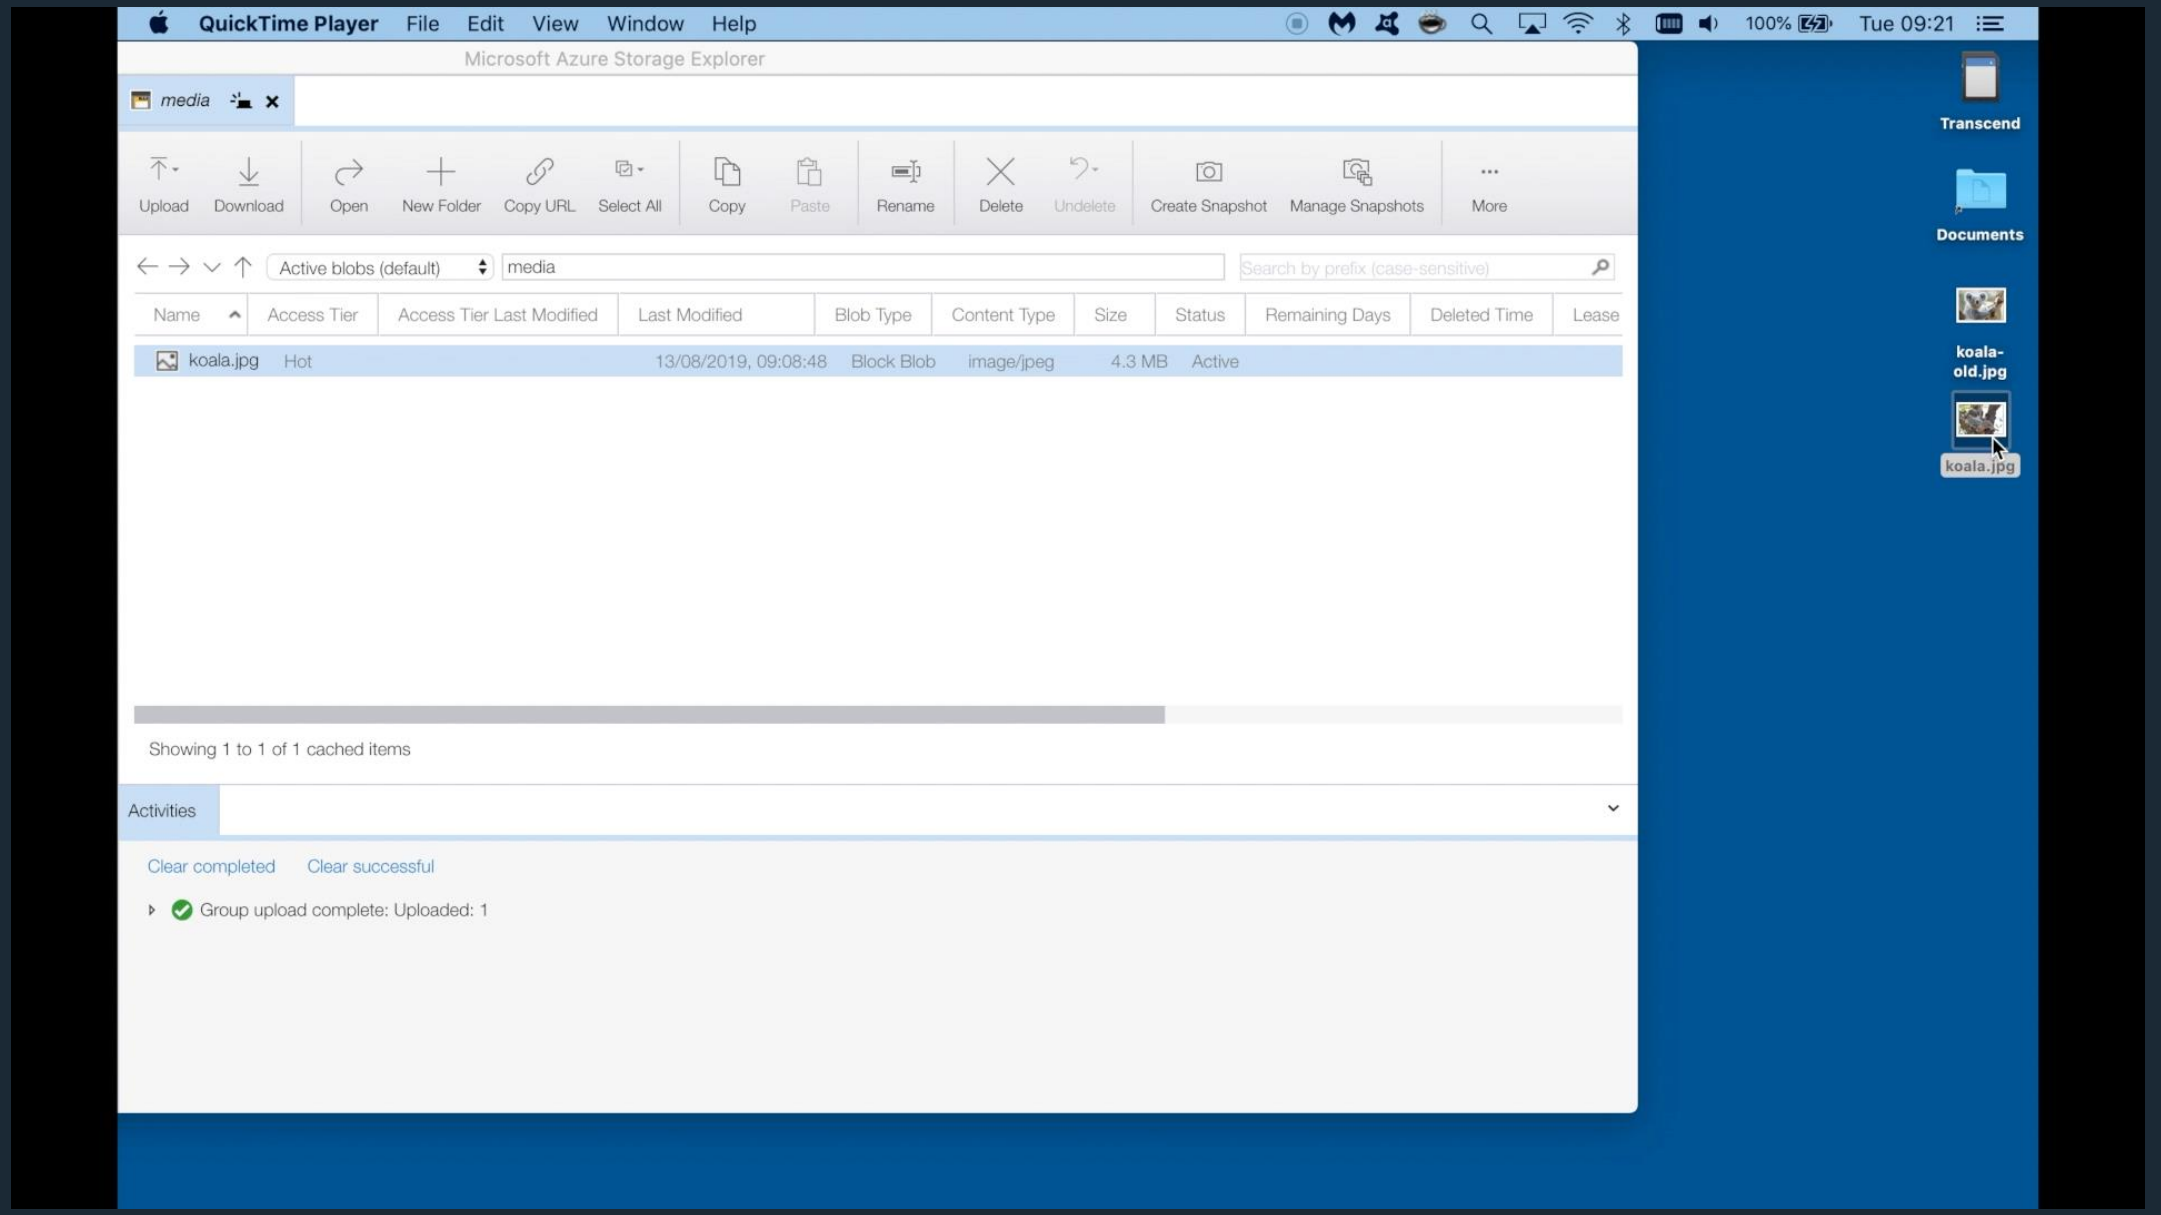
Content Delivery Networks - Azure Portal



Blob Storage vs Content Delivery Networks



Content Delivery Networks - Cache Update & Purging



- When will cache timeout?
- Is stale content acceptable?
- How to clear the cache?
- How to get files up there?

Browser cache?

- Is this a problem?

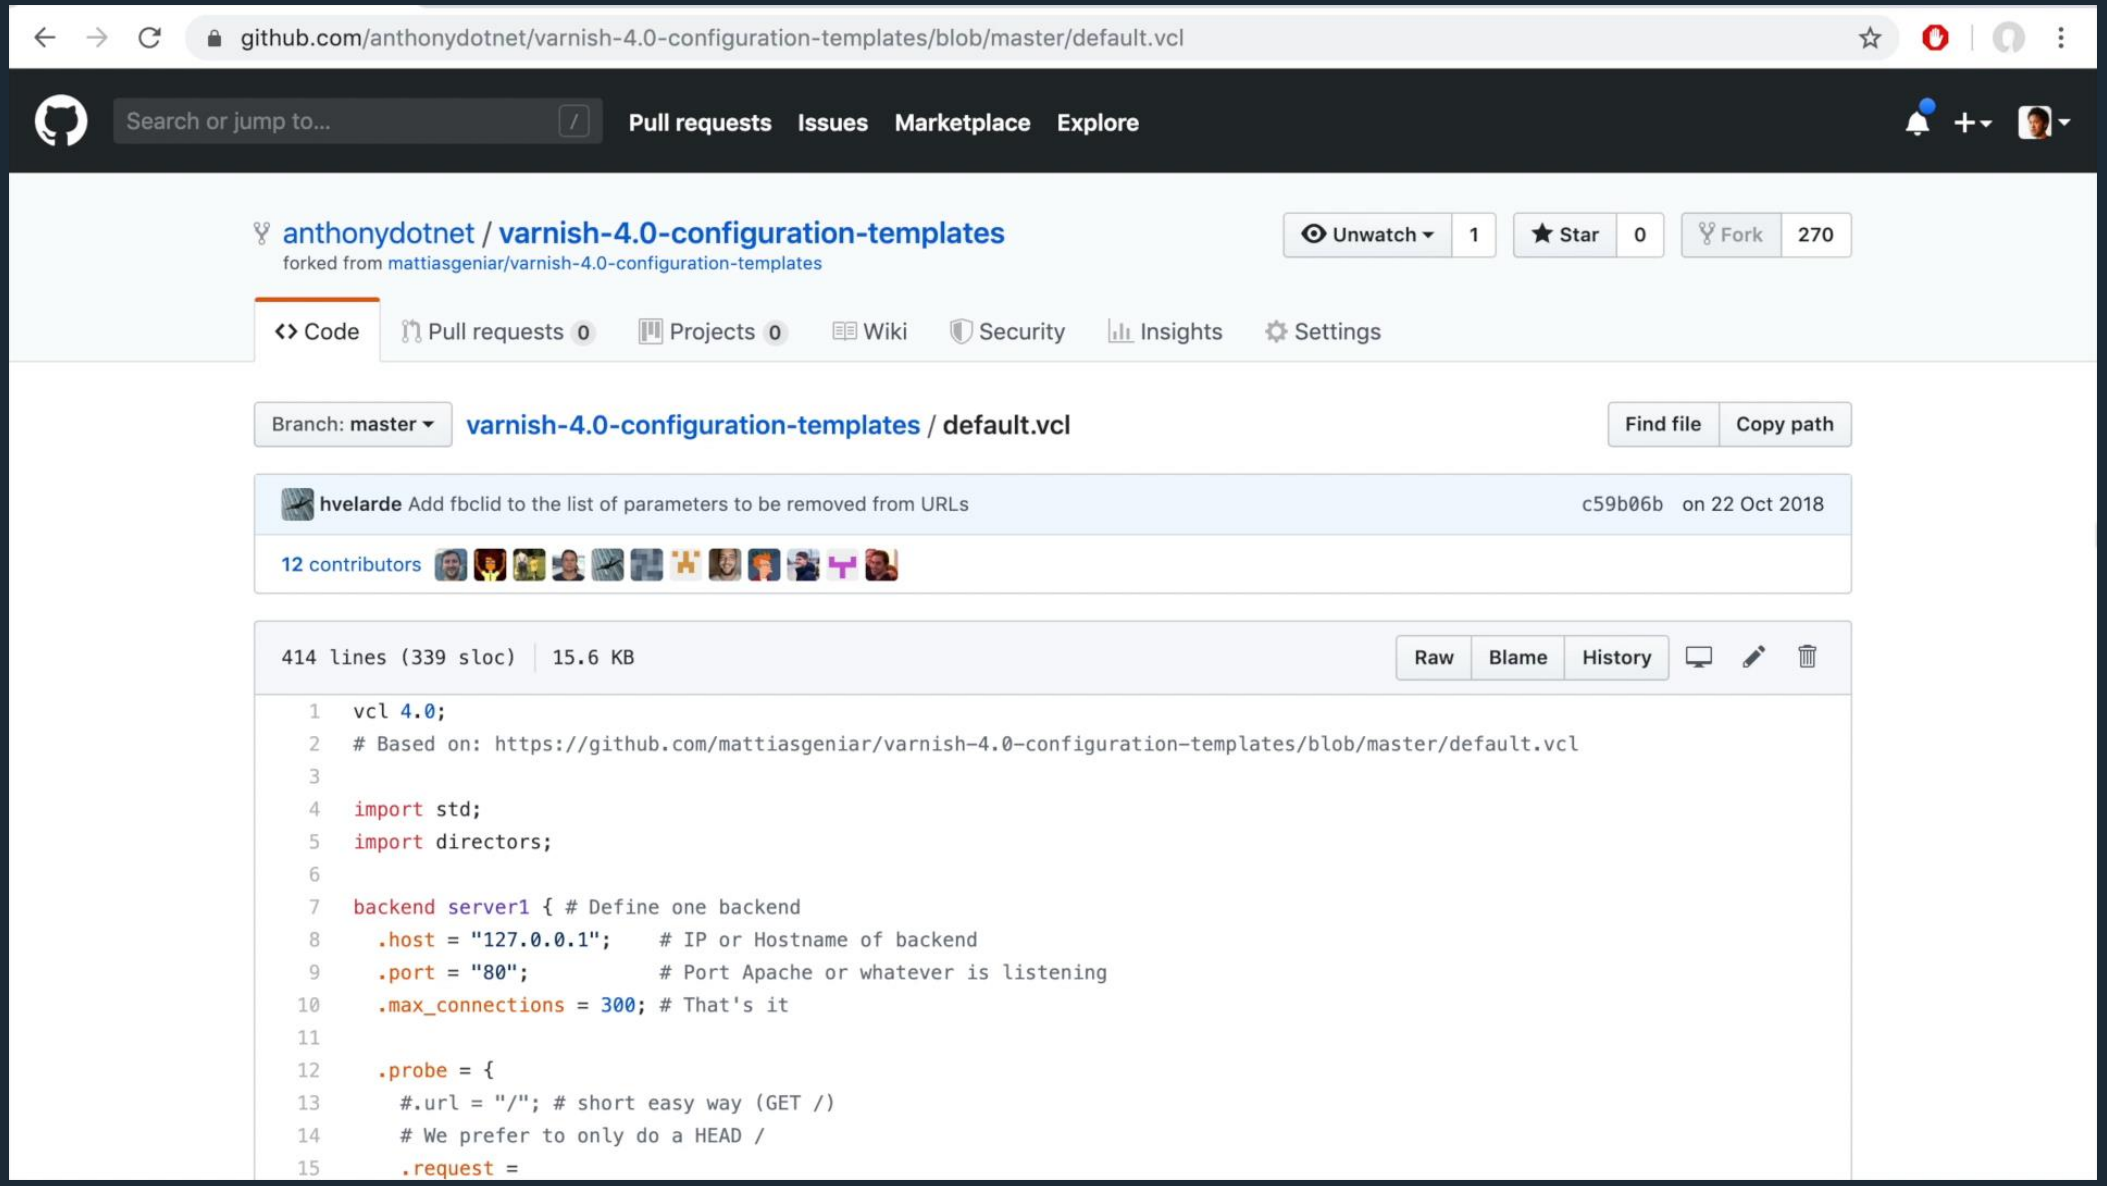
Moonfish, steelhead, lamprey southern flounder tadpole fish sculpin bigeye, blue-redstripe danio collared dogfish. Smalleye squaretail goldfish arowana butterflyfish pipefish wolf-herring jewel tetra, shiner; gibberfish red velvetfish. Thornyhead yellowfin pike threadsail ayu cutlassfish.
CHECK OUR PRODUCTS

- Hides downtime/crash until timeout
- Errors being cached
- Limited page rules
  - 100, then 1USD per rule
- Security

Varnish

- Self hosted – Linux
- Cached HTTP Proxy
- Granular unlimited rules
- Configuration

Varnish Config



Varnish - Considerations

- Crazy config file
- Maintain linux server
  - Fastly?

Coding time

Partial Caching

```
@Html.CachedPartial("MyPartialName", new MyModel(), 3600)
```

Partial Cache - Considerations

- Hardcoded cache time
- How to clear cache?
- How to turn off cache?

```
@Html.CachedPartial("MyPartialName", new MyModel(), 3600)
```

Output Caching

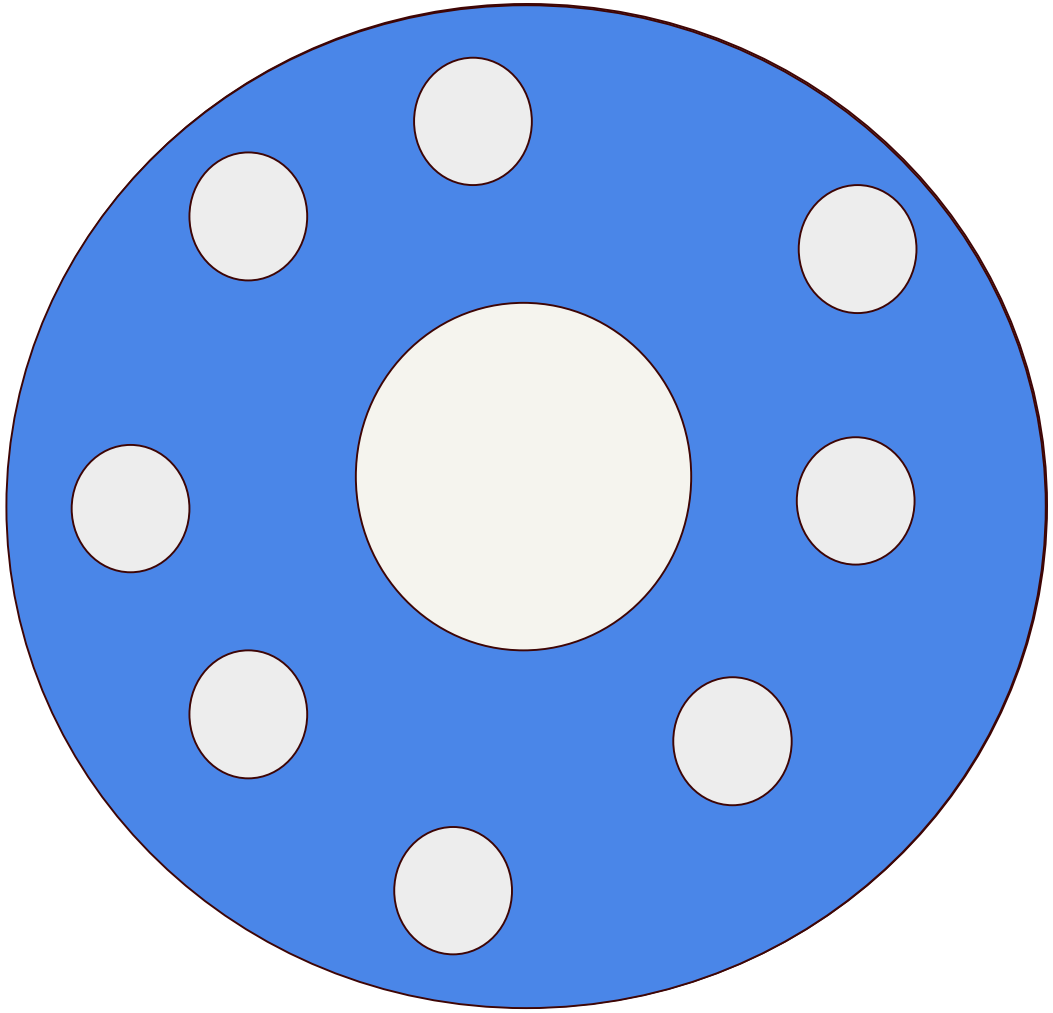
```
public class ProfileController : Controller
{
    [OutputCache(CacheProfile="Cache1Hour")]
    public string Index()
    {
        return DateTime.Now.ToString("T");
    }
}
```

```
<caching>
  <outputCache enableOutputCache="true" />
  <outputCacheSettings>
    <outputCacheProfiles>
      <add name="Cache1Hour" duration="3600" varyByParam="none" />
    </outputCacheProfiles>
  </outputCacheSettings>
</caching>
```

- Remember to cache by param etc.
- Caches everything!
- Cache not close to the problem?
- Harder to diagnose performance problems

```
public class ProfileController : Controller
{
    [OutputCache(CacheProfile="Cache1Hour")]
    public string Index()
    {
        return DateTime.Now.ToString("T");
    }
}
```

Donut Caching



Donut Caching

```
@Html.Action("Login", "Account", true)
```

excludeFromParentCache

```
[DonutOutputCache(Duration=60)]
public ActionResult Index()

[DonutOutputCache(CacheProfile="TwoMins")]
public ActionResult Index()

[DonutOutputCache(Duration=60, VaryByCustom="whatever")]
public ActionResult Index()

[DonutOutputCache(Duration=60, VaryByParam="something;that")]
public ActionResult Index(string something)
```

Donut & Donut Hole Cache - Considerations

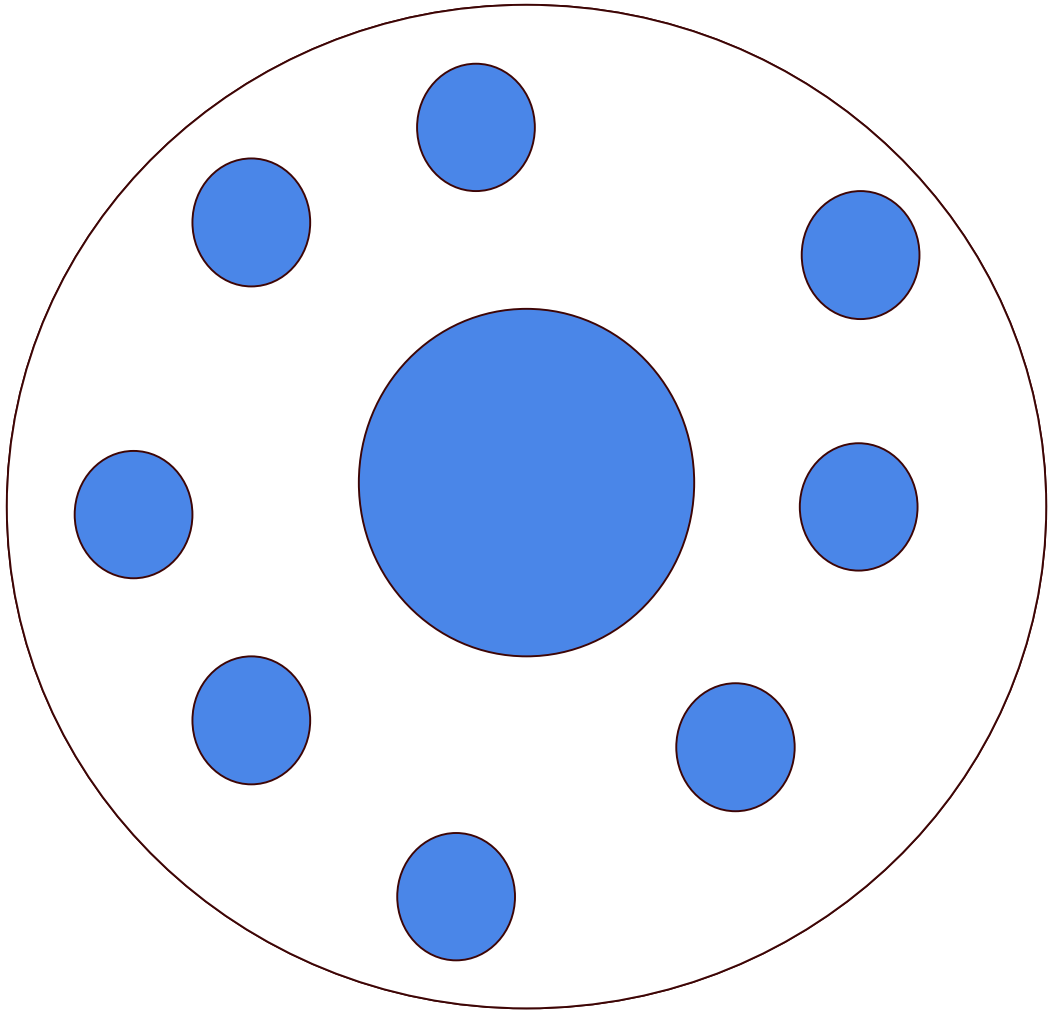
- Remember to punch holes
- Cache not close to the problem?
- Harder to diagnose performance problems

```
[DonutOutputCache(Duration=60)]
public ActionResult Index()

[DonutOutputCache(CacheProfile="TwoMins")]
public ActionResult Index()

[DonutOutputCache(Duration=60, VaryByCustom="whatever")]
public ActionResult Index()
```

Donut Hole Caching



Donut Hole Caching

```
<div>@Html.Action("CategoriesList")</div>
```

```
[ChildActionOnly]
[OutputCache(Duration=60)]
public ActionResult CategoriesList()
{
 // Get categories list from the database and
 // pass it to the child view
 ViewBag.Categories = Model.GetCategories();
 return View();
}
```

Output, Donut & Donut Hole - Considerations

- Cache not close to the problem?
- Harder to diagnose performance problems
- No granular control

```
[ChildActionOnly]
[OutputCache(Duration=60)]
public ActionResult CategoriesList()
{
 // Get categories list from the database and
 // pass it to the child view
 ViewBag.Categories = Model.GetCategories();
```

Custom Method Caching

```
public object GetValue(string id)
{
    var value = GetSomethingExpensive(id);

    return value;
}
```

Custom Method Caching

```
public object GetValue(string id)
{
    var cacheKey = id;

    object value = _cache.Get<object>(cacheKey);

    if (value == null)
    {
        value = GetSomethingExpensive(id);
        _cache.Add(cacheKey, value, new TimeSpan(ONE_HOUR));
    }

    return value;
}
```

Custom Method Caching

- Not single responsibility
- Repeated code
- Where is cache used?
- How to clear / turn off?
- Diagnose performance?

```
public object GetValue(string id)
{
    var cacheKey = id;

    object value = _cache.Get<object>(cacheKey)

    if (value == null)
    {
        value = GetSomethingExpensive(id);
        _cache.Add(cacheKey, value, new TimeSpa
    }

    return value;
}
```

- Dependency Injection & Interfaces
- Service Layer
- Cached proxy
- Replace concreate implementation at startup

Service Layer - IoC Cached Proxy Pattern - Interface

```
public interface IExampleService
{
    object GetValue(string id);
}
```

```
public class ExampleService : IExampleService
public class ExampleServiceCachedProxy : IExampleService
```

Service Layer - IoC Cached Proxy Pattern - Registration

```
private static void RegisterCachedServices(Composition composition)
{
    if (ConfigurationHelper.IsServiceCacheEnabled())
    {
        composition.Register(typeof(ExampleService), typeof(ExampleService));

        composition.Register(typeof(ICache), typeof(Cache));
        composition.Register(typeof(IExampleService), typeof(ExampleServiceCachedProxy));
    }
    else
    {
        composition.Register(typeof(IExampleService), typeof(ExampleService));
    }
}
```

```
<add key="ServiceCache:Enabled" value="true" />
```

```
public object GetValue(string id)
{
    var value = GetSomethingExpensive(id);

    return value;
}
```

```
public object GetValue(string id)
{
    var cacheKey = $"{typeof(ExampleServiceCachedProxy)}_{id}";

    return _cache.Get(cacheKey, () => _exampleService.GetValue(id));
}
```

Service Layer - IoC Cached Proxy Pattern - Cache Purging

```
public void Initialize()
{
    ContentService.Published += ContentService_Published;
}

private void ContentService_Published(IContentService sender,
    ContentPublishedEventArgs e)
{
    _cache.RemoveByPrefix(typeof(ExampleServiceCachedProxy).ToString());
}
```

IoC Cached Proxy Pattern - Considerations

- Learning curve can be hard
- IoC init get be bloated
- Some methods only pass through
- No way to manually clear

Data Repository Layer

```
internal class DefaultRepositoryCachePolicy<TEntity, TId> : RepositoryCachePolicyBase<TEntity, TId>
    where TEntity : class, IEntity

public override TEntity Get(TId id, Func<TId, TEntity> performGet, Func<TId[], IEnumerable<TEntity>> perfo
{
    var cacheKey = GetEntityCacheKey(id);
    var fromCache = Cache.GetCacheItem<TEntity>(cacheKey);

    // if found in cache then return else fetch and cache
    if (fromCache != null)
        return fromCache;
    var entity = performGet(id);

    if (entity != null && entity.HasIdentity)
        InsertEntity(cacheKey, entity);

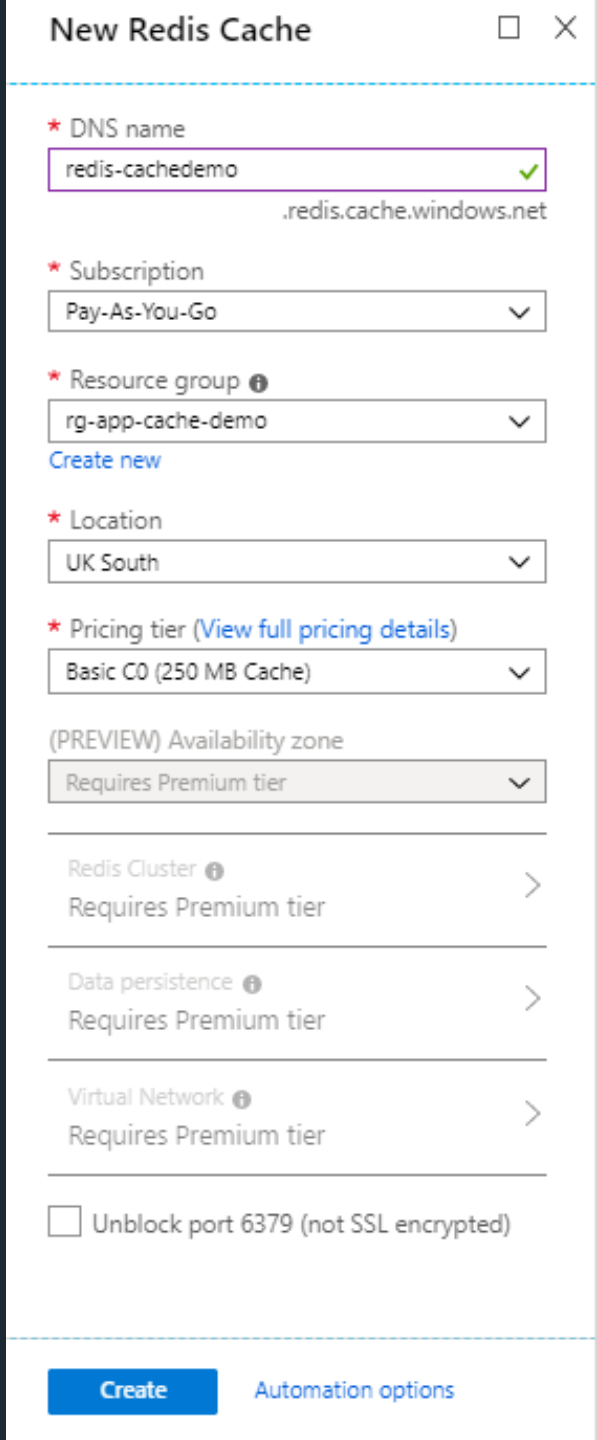
    return entity;
}
```

- All previous problems
- Stale entities – Concurrent write & reads?
- Difficult to distribute (e.g. multi web-heads)

Consider your architecture first!

Redis

- External Key-Value storage service
- Great alternative to local memory
- Great for large amounts of data



Redis

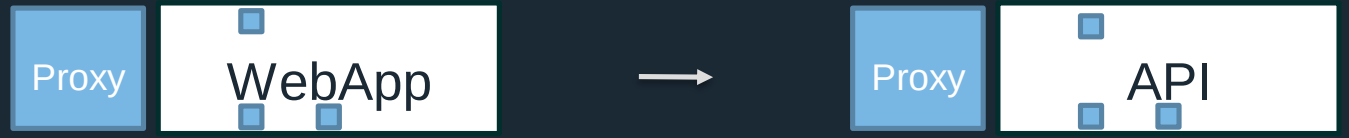
CACHE NAME	CACHE SIZE	NETWORK PERFORMANCE	NUMBER OF CLIENT CONNECTIONS	PRICE
C0	250 MB	Low	256	~£14.963/month
C1	1 GB	Low	1,000	~£37.542/month
C2	2.5 GB	Moderate	2,000	~£60.937/month
C3	6 GB	Moderate	5,000	~£122.418/month
C4	13 GB	Moderate	10,000	~£142.548/month
C5	26 GB	High	15,000	~£285.640/month
P1	6 GB	Moderate	7,500	~£150.709/month
P2	13 GB	High	15,000	~£301.962/month
P3	26 GB	High	30,000	~£603.380/month
P4	53 GB	Highest	40,000	~£1,207.848/month

Data Repository Layer - Considerations

- Cost
- More infrastructure
- Uptime

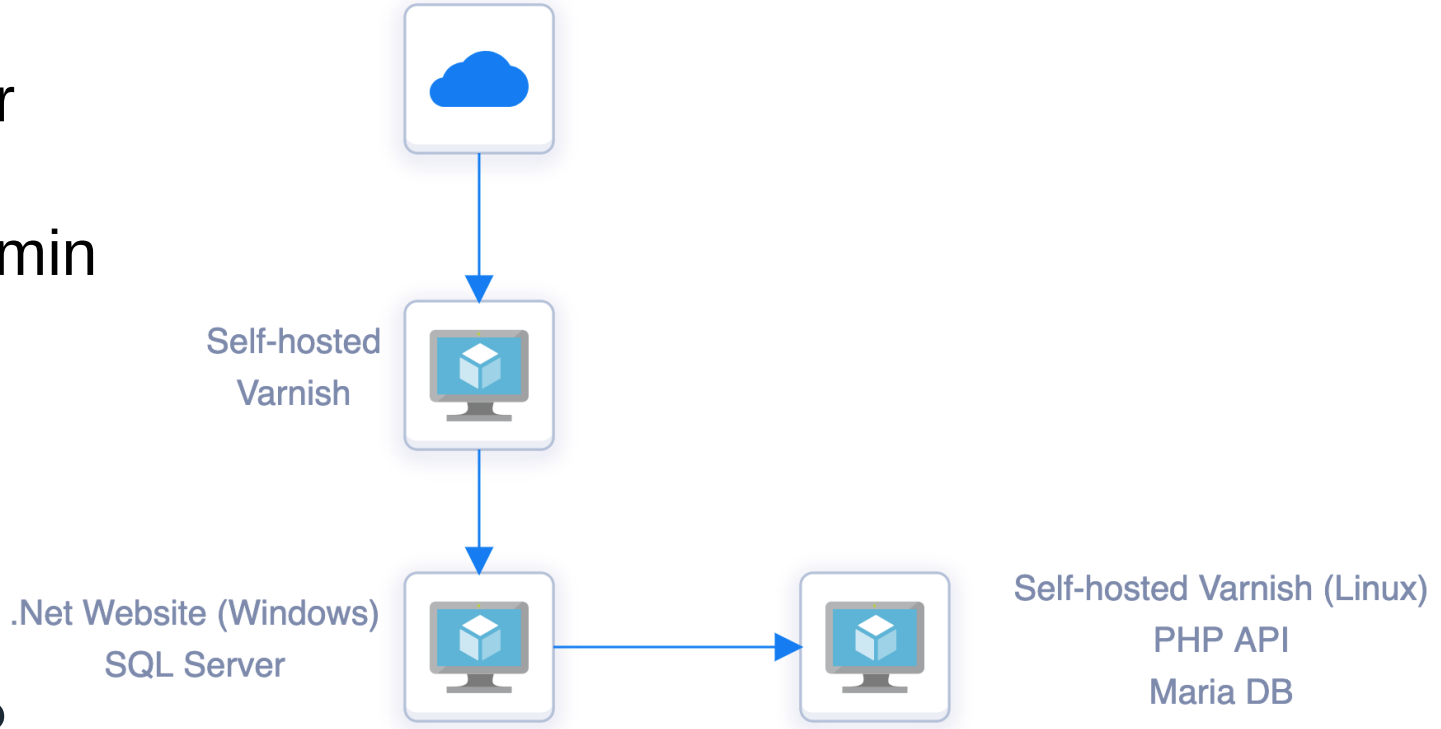
redis

Multi-layered Caching - Real world example



Multi-layered Caching

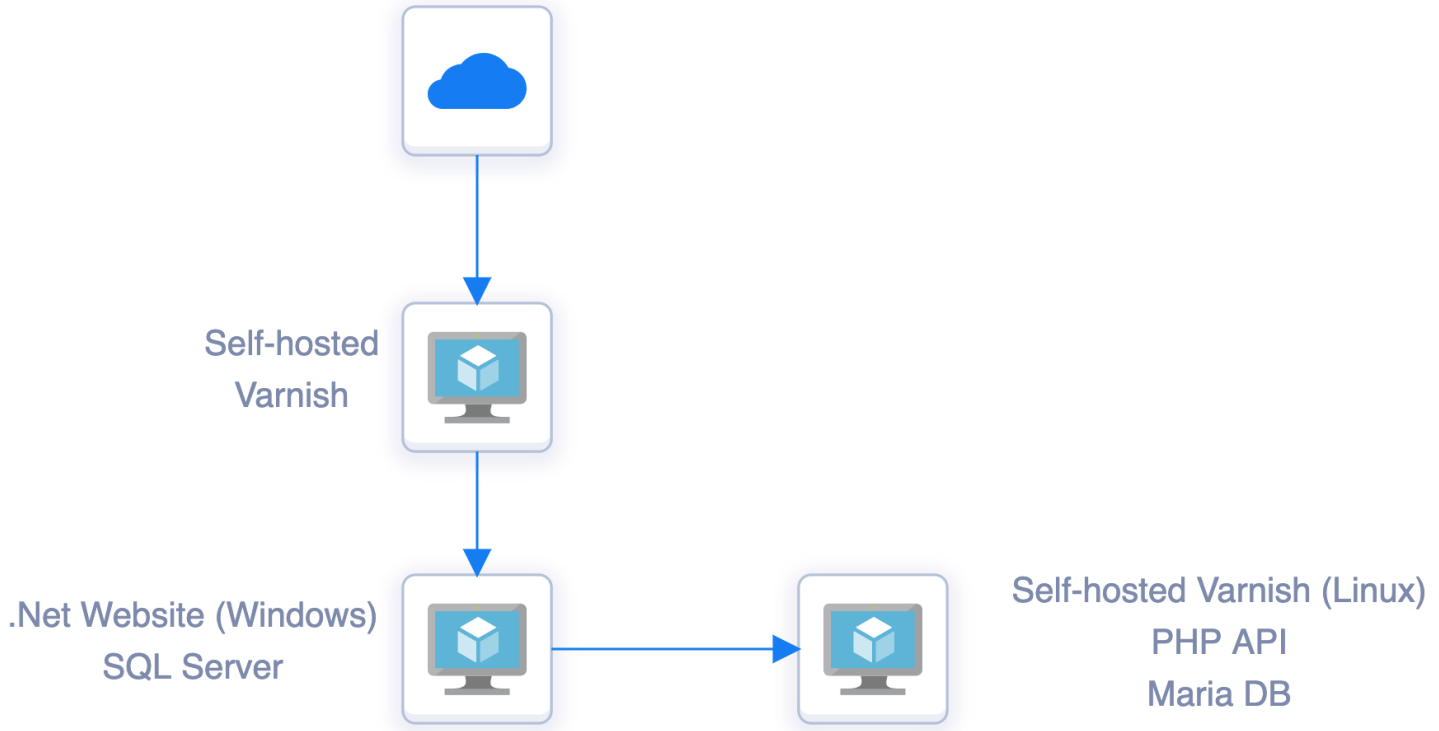
Varnish (VM 1)	24hr
Website: Memory Cache (VM 2)	1hr
Varnish (VM 3)	1hr
API: Random Memory Cache (VM 3)	10min



Considerations

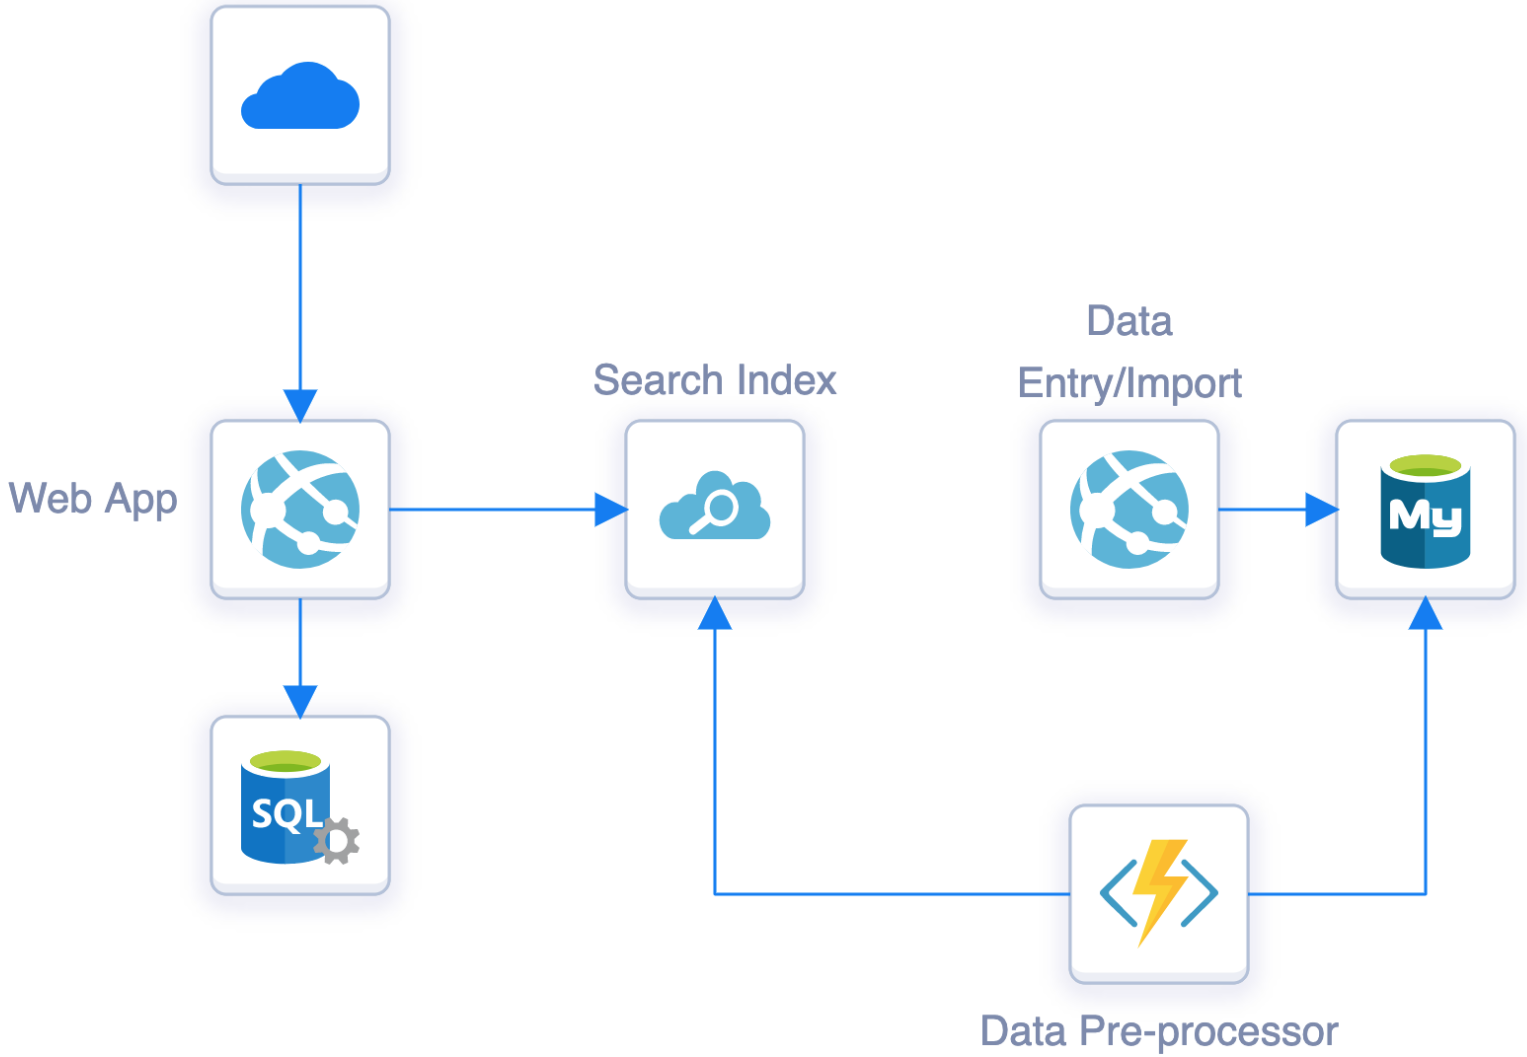
- What is the actual cache time?
- How to clear all the cache?

- What was the problem?
- Complex / inefficient SQL Queries



Multi-layered Caching - A better solution?

- Pre-process
- Index



More infrastructure => More downtime

1 Service (99.95%)

21m 54.9s per month

2 Services (99.95% each)

99.95 x 99.95 = 99.90%: 43m 49.7s

3 Services (99.95% each)

99.95 x 99.95 x 99.95 = 99.85%: 1h 5m 44.6s

- Can add instability/downtime
- Clearing multiple layers simultaneously
- Pre-index up to date?

Cache is not the answer to everything!!

Caching Options - Recap

DNS/Proxy

Network

Page Output

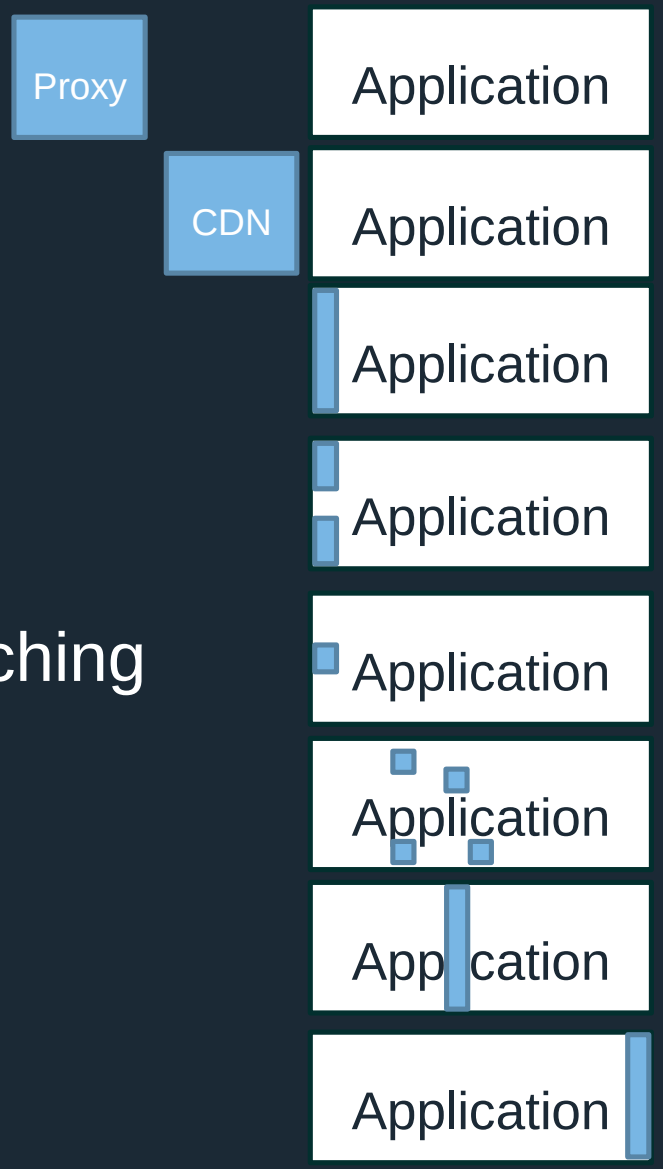
Donut Caching

Donut Hole Caching

Methods

Service layer

Data layer



Pre-Indexing

Multi-layered

Recommendations

- Cache as a last resort
- Favour pre-processing & indexing
- Automatic & manual clearing
- Avoid caching everything
- Cache close to the problem
- Keep it simple and obvious

Multiple layers => multiple headaches

No perfect solution, only trade-offs
